Index	3
--------------	----------

json_validate	<i>Validate a json file</i>
---------------	-----------------------------

Description

Validate a single json against a schema. This is a convenience wrapper around `json_validator(schema)(json)`

Usage

```
json_validate(json, schema, verbose = FALSE, greedy = FALSE,  
             error = FALSE)
```

Arguments

json	Contents of a json object, or a filename containing one.
schema	Contents of the json schema, or a filename containing a schema.
verbose	Be verbose? If TRUE, then an attribute "errors" will list validation failures as a data.frame
greedy	Continue after the first error?
error	Throw an error on parse failure? If TRUE, then the function returns NULL on success (i.e., call only for the side-effect of an error on failure, like stopifnot).

json_validator	<i>Create a json validator</i>
----------------	--------------------------------

Description

Create a validator that can validate multiple json files.

Usage

```
json_validator(schema)
```

Arguments

schema	Contents of the json schema, or a filename containing a schema.
