## Package 'cols4all'

February 2, 2023

**Description** Color palettes for all people, including those with color vision deficiency. Popu-

lar color palette series have been organized by type and have been scored on several properties such as color-blind-friendliness and fairness (i.e. do colors stand out equally?). Own palettes can also be loaded and analysed. Besides the common palette types (categorical, sequential, and diverging) it also includes bivariate color palettes. Furthermore, a color for missing values is assigned to each palette. Version 0.6 Date 2023-01-30 **Encoding UTF-8 Depends** R (>= 3.5.0), Imports methods, grDevices, stats, abind, png, stringdist, colorspace **Suggests** colorblindcheck, kableExtra, knitr, shiny, shinyjs, ggplot2, scales, rmarkdown URL https://github.com/mtennekes/cols4all BugReports https://github.com/mtennekes/cols4all/issues VignetteBuilder knitr RoxygenNote 7.2.3 NeedsCompilation no Author Martijn Tennekes [aut, cre], Marco Puts [ctb], Achim Zeileis [ctb], Jakub Nowosad [ctb], Robin Lovelace [ctb], Helgasoft [ctb], Matthew Petroff [ctb]

## Description

cols4all stands for: color palettes for all people, including those with color vision deficiency. Popular color palette series, such as ColorBrewer, have been organized by type and have been scored on several properties such as color-blind-friendliness and fairness (i.e. do colors stand out equally?). Own palettes can also be loaded and analysed. Besides the common palette types (categorical, sequential, and diverging) it also includes bivariate color palettes. ggplot2 scales are included.

## **Details**

This page provides a brief overview of all package functions.

#### **Main functions**

```
c4a_gui Dashboard for analyzing the palettes
c4a Get the colors from a palette (c4a_na for the associated color for missing values)
c4a_plot Plot a color palette
```

## Palette names and properties

c4a 3

```
c4a_palettes
c4a_series
C4a_series
C4a_overview
C4a_citation
C4a_info
CP
Get available palette names
Get available series names
Get an overview of palettes per series x type
C4a_citation
C4a_info
C5 Get information from a palette, such as type and maximum number of colors)
Environment via which palette names can be browsed with auto-completion (using $)
```

## Importing and exporting palettes

## Author(s)

Martijn Tennekes <mtennekes@gmail.com>

c4a

Get a cols4all color palette

## **Description**

Get a cols4all color palette: c4a returns the colors of the specified palette, and c4a\_na returns the color for missing value that is associated with the specified palette. Run c4a\_gui to see all available palettes, which are also listed with c4a\_palettes.

```
c4a(
  palette = NULL,
  n = NA,
  m = NA,
  type = c("cat", "seq", "div", "bivs", "bivc", "bivd", "bivg"),
  reverse = FALSE,
  order = NULL,
```

4 c4a

```
range = NA,
format = c("hex", "RGB", "HCL"),
nm_invalid = c("error", "repeat", "interpolate"),
verbose = TRUE
)

c4a_na(palette = NULL, type = c("cat", "seq", "div"), verbose = TRUE)
```

#### Arguments

palette name of the palette. See c4a\_palettes for options. If omitted, the default

palette is provided by c4a\_default\_palette. The palette name can be prefixed with a "-" symbol, which will reverse the palette (this can also be done with the

reverse argument).

n number of colors. If omitted then: for type "cat" the maximum number of

colors is returned, for types "seq" and "div", 9 colors.

m number of rows in case type is "bivs", "bivc", "bivd" or "bivg" (which

stand for respectively sequential, categorical, diverging and desaturated (g for

'grayscale')).

type type of color palette, in case palette is not specified: one of "cat" (categor-

ical/qualitative palette), "seq" (sequential palette), "div" (diverging palette), and "bivs"/"bivc"/"bivd"/"bivg" (bivariate: respectively seq-seq seq-cat, seq-

div, and seq-desaturated).

reverse should the palette be reversed?

order order of colors. Only applicable for "cat" palettes

range a vector of two numbers between 0 and 1 that determine the range that is used

for sequential and diverging palettes. The first number determines where the palette begins, and the second number where it ends. For sequential "seq" palettes, 0 means the leftmost (normally lightest) color, and 1 the rightmost (often darkest) color. For diverging "seq" palettes, 0 means the middle color, and 1 both extremes. If only one number is provided, this number is interpreted

as the endpoint (with 0 taken as the start).

format format of the colors. One of: "hex" character vector of hex color values, "RGB"

3 column matrix of RGB values, or "HCL" 3-column matrix of HCL values

nm\_invalid what should be done in case n or m is larger than the maximum number of col-

ors or smaller than the minimum number? Options are "error" (an error is returned), "repeat", the palette is repeated, "interpolate" colors are interpo-

lated. For categorical "cat" palettes only.

verbose should messages be printed?

## Value

A vector of colors (c4a) and a color (c4a\_na)

c4a\_citation 5

## **Examples**

```
c4a_palettes("div")
c4a(type = "cat")

(pal = c4a("tol.sunset", n = 7, range = c(0, .6)))
c4a_plot(pal)

c4a("set2")

c4a("hcl.set2")

c4a("hcl.set2", n = 8)

# reversed palette
c4a("hcl.set2", reverse = TRUE, n = 8)

# handy shortcut
c4a("-hcl.set2", n = 8)

# the color for missing values is white:
c4a_na("hcl.set2")
```

c4a\_citation

Show how to cite palettes

## Description

Show how to cite palettes

## Usage

```
c4a_citation(name, verbose = TRUE)
```

## **Arguments**

name of a palette or series

verbose should text be printed (if FALSE only a utils::bibentry object is returned)

#### Value

```
utils::bibentry object
```

```
c4a_citation("hcl")
c4a_citation("poly.glasbey")
```

c4a\_data

Build and load palette data

## **Description**

Build palette data. Both c4a\_data and c4a\_data\_as\_is build data palette. The difference is that the former may restructure the palette colors (see details) whereas the latter takes the palette colors as they are. Data can subsequently be loaded into cols4all via c4a\_load.

```
c4a_data(
  х,
  xNA = NA,
  types = "cat",
  series = x^*,
 nmin = NA,
 nmax = NA,
 ndef = NA,
 mmin = NA,
 mmax = NA,
 mdef = NA,
  format.palette.name = TRUE,
  remove.blacks = TRUE,
  take.gray.for.NA = TRUE,
  remove.other.grays = FALSE,
  light.to.dark = TRUE,
  remove.names = TRUE,
  biv.method = "byrow",
  space = "rgb",
  range_matrix_args = list(NULL),
 bib = NA,
  description = NA
)
c4a_load(data)
c4a_data_as_is(
  format.palette.name = FALSE,
  remove.blacks = FALSE,
  take.gray.for.NA = FALSE,
  remove.other.grays = FALSE,
  light.to.dark = FALSE,
  remove.names = FALSE
)
```

#### **Arguments**

x named list of color palettes. See details for indexing.

xNA colors for missing values. Vector of the same length as x (or length 1). For NA

values, the color for missing values is automatically determined (preferable a light grayscale color, but if it is indistinguishable by color blind people, a light

color with a low chroma value is selected)

types character vector of the same length as x (or length 1), which determines the

type of palette: "cat", "seq", "div", "bivs", "bivc", "bivd", or "bivg". See

details.

series a character vector of the same length as x (or length 1), which determines the

series.

nmin, nmax, ndef

minimum / maximum / default number of colors for the palette. By default: nmin = 1, for "cat" nmax and ndef the number of supplied colors. For the other types, nmax is Inf. ndef is 7 for "seq", 9. For diverging palettes, these numbers

refer to the number of columns. (See mmin, mmax, mdef for the rows)

mmin, mmax, mdef

minimum / maximum / default number of rows for bivariate palettes.

format.palette.name

should palette names be formatted to lowercase/underscore format?

remove.blacks, take.gray.for.NA, remove.other.grays

These arguments determine the processing of grayscale colors for categorical "cat" palettes: if remove.blacks and there are (near) blacks, these are removed first. Next, if take.gray.for.NA, xNA is NA, and a palette contains at least one grayscale color (which can also be white), this is used as color for missing values. In case there are more than one grayscale color, the lightest is taken.

remove.other.grays determines what happens with the other grays.

light.to.dark should sequential "seq" palettes be automatically ordered from light to dark?

remove.names should individual color names be removed?

biv.method method to a create bivariate palette. Options are "byrow" means that the colors

are wrapped row-wise to a color matrix where the number of rows and columns is automatically determined, "byrowX" the same but with X (integer between 2 and 9) columns, "byco1" and "byco1X similar but wrapped column-wise. "div2seqseq" and "div2catseq means that colors are extracted from a divering palette. The former translates colors into a matrix with the neutral color in the diagonal, while the latter places the neutral color in the middle column.

"seq2uncseq"

space color space in which interpolated colors are determined. Options: "rgb" (RGB)

and "Lab" (CIE Lab).

range\_matrix\_args

list of lists, one for each palette. Each such list specifies the range of sequential

and diverging palettes, in case they are not indexed. See details.

bib bibtex reference in the form of a utils::bibentry object.

description description of the series. If series contains multiple series (rather than one

value), please specify a vector of the same length as series. See c4a\_series

for the descriptions of the currently loaded series.

data cols4all data created with c4a\_data

... passed on to c4a\_data

#### **Details**

In cols4all, palettes are organized by series and by type. The **series** or 'family' specifies where the palettes belong to. For instance "brewer" stands for the color palettes from ColorBrewer. Run c4a\_series to get an overview of loaded series. The **type** specifies what kind of palette it is; see c4a\_types for a description of the implemented ones.

This function structures the palette data, such that it is consistent with the other palette data. This includes:

- Palette names are made consistent. We use the convention "my\_series.my\_palette", so all lower case, a period to separate the series name from the palette name, and underscores to separate words.
- (Only for c4a\_data, bypassed for c4a\_data\_as\_is) Categorical palettes: black is removed from categorical palettes, and a grayscale color is assigned to be used for missing values (other grayscale colors are removed). Sequential palettes are sorted from light to dark.

Indexing: for a categorical "cat" palette, an optional "index" attribute determines which colors to use for which lengths: if the palette consists of k colors, index should be a list of k, where the i-th element is an integer vector of length i with values 1,2,...,k. See c4a\_info("rainbow") and for an example.

Range: sequential and diverging palettes are usually defined for 9+ colors. The optional "range\_matrix" attribute determines that range is used for less colors. It is a n x 2 matrix where row i defines the applied range of a palette of length i. For sequential palettes a range c(0,1) means that the palette is generated (via a color ramp) between the two outermost colors. For diverging palettes, a range c(x, y) means that both sides of the palette are generated (via a color ramp) from x, which is the distance to the center color, to y which represents both outermost colors.

The range is automatically set for sequential and diverging palettes that have no "index" or "range\_matrix" attribute via the parameter range\_matrix\_args, which is a list per palette. The arguments for a sequential palette are: nmin the minimum number of colors for which the range is reduced, nmax, the number of colors for which the range is set to c(0,1), slope\_min and slope\_max determine the slopes of range reduction from a palette of length nmax to nmin, and space sets the color space for which the color ramp is applied ("rgb" or "Lab"). The arguments for a diverging palette are the same, but only one slope is used (namely for the outermost colors).

It may take some time to process, especially large categorical palettes, because of calculations of the color blind checks.

#### Value

c4a\_data object, which is a list of four items: data, s, citation, and description

```
# palettes extracted Pink Floyd albums
pf = list(piper = c("#391C1C", "#C6C6AA", "#713939", "#C6391C",

```

10 *c4a\_gui* 

c4a\_gui

Graphical user interface to analyse palettes

## **Description**

Graphical user interface to analyse palettes. c4a\_table shows a table that can be opened in the browser. c4a\_gui is a graphical user interface (shiny app) around this table.

## Usage

```
c4a_gui(type = "cat", n = NA, series = "all")
c4a_table(
  type = c("cat", "seq", "div", "bivs", "bivc", "bivd", "bivg"),
  n = NULL,
 m = NULL
  cvd.sim = c("none", "deutan", "protan", "tritan"),
  sort = "name",
  text.format = "hex",
  text.col = "same",
  series = "all",
  range = NA,
  include.na = FALSE,
  show.scores = FALSE,
  columns = NA,
  verbose = TRUE
)
```

## **Arguments**

type	type of palette. Run c4a_types to see the implemented types and their description. For c4a_gui it only determines which type is shown initially.
n, m	n is the number of displayed colors. For bivariate palettes "biv", n and m are the number of columns and rows respectively. If omitted: for "cat" the full palette is displayed, for "seq" and "div", 9 colors, and for "bivs"/"bivc"/"bivd"/"bivg' 4 columns and rows. For c4a_gui it only determines which number of colors initially.
series	Series of palettes to show. See c4a_series for options. By default, "all", which means all series. For c4a_gui it only determines which series are shown initially.
cvd.sim	color vision deficiency simulation: one of "none", "deutan", "protan", "tritan"
sort	column name to sort the data. The available column names depend on the arguments type and show.scores. They are listed in the warning message. Use a "-" prefix to reverse the order.
text.format	The format of the text of the colors. One of "hex", "RGB" or "HCL".

c4a\_gui 11

 ${\tt text.col} \qquad \qquad {\tt The \ text \ color \ of \ the \ colors. \ By \ default \ "same", \ which \ means \ that \ they \ are \ the}$ 

same as the colors themselves (so invisible, but available for selection). "auto"

means automatic: black for light colors and white for dark colors.

range vector of two numbers that determine the range that is used for sequential and

diverging palettes. Both numbers should be between 0 and 1. The first number determines where the palette begins, and the second number where it ends. For sequential palettes, 0 means the leftmost (normally lightest) color, and 1 the rightmost (often darkest) color. For diverging palettes, 0 means the middle color, and 1 both extremes. If only one number is provided, this number is interpreted as the endpoint (with 0 taken as the start). By default, it is set automatically,

based on n.

include.na should color for missing values be shown? FALSE by default

show. scores should scores of the quality indicators be printed? See details for a description

of those indicators.

columns number of columns. By default equal to n or, if not specified, 12. Cannot be

higher than the palette lengths.

verbose should messages and warnings be printed?

#### Value

An HMTL table (kableExtra object)

#### See Also

References of the palettes: cols4all-package.

```
if (requireNamespace("shiny") &&
    requireNamespace("shinyjs") &&
    requireNamespace("kableExtra") &&
    requireNamespace("colorblindcheck") &&
    interactive()) {

c4a_gui()

# categorical palettes with maximum number of colors
c4a_table(type = "cat")

# sort sequential palettes by hue
c4a_table(type = "seq", n = 7, sort = "H")

# sort sequential palettes by hue type (how many hues are used)
c4a_table(type = "seq", n = 5, sort = "hueType")
}
```

12 c4a\_options

c4a\_info

Get information from a cols4all palette

## Description

Get information from a cols4all palette

## Usage

```
c4a_info(palette, no.match = c("message", "error", "null"), verbose = TRUE)
```

## Arguments

palette name of the palette

no.match what happens is no match is found? Options: "message": a message is thrown

with suggestions, "error": an error is thrown, "null": NULL is returned

verbose should messages be printed?

#### Value

list with the following items: name, series, fullname, type, palette (colors), na (color), nmax, and reverse. The latter is TRUE when there is a "-" prefix before the palette name.

c4a\_options

Set cols4all options

## **Description**

Get or set global options for c4a. Works similar as the base function options

## Usage

```
c4a_options(...)
```

## **Arguments**

... Use character values to retrieve options. To set options, either use named arguments (where the names refer to the options), a list that consists of those options.

c4a\_palettes

#### **Details**

Option		Description
defaults		Default palettes per type
CBF_th		Parameters that label a palette as color blind friendly
CBU_th		Parameters that label a palette as color blind unfriendly
CrangeFa	air	Maximum chroma range for which a palette is considered harmonic
CrangeU	nfair	Minimum chroma range for which a palette is considered disharmonic
LrangeFa	ıir	Maximum luminance range for which a palette is considered harmonic
LrangeU	nfair	Minimum luminance range for which a palette is considered disharmonic
Cintense		Chroma of colors that are considered intense
Cpastel		Chroma of colors that are considered 'pastel'
HwidthD	ivRainbow	A diverging palette is labeled as 'rainbow hue' if HwidthL or HwidthR are at least HwidthDivRainbow
HwidthD	ivSingle	A diverging palette is labeled as 'single hue' if HwidthL and HwidthR are at most HwidthDivSingle
HwidthS	eqRainbow	A sequential palette is labeled as 'rainbow hue' if Hwidth is at least HwidthSeqRainbow
HwidthS	eqSingle	A sequential palette is labeled as 'single hue' if Hwidth is at most HwidthSeqSingle

## Value

A list of options

c4a_palettes	Get available palette names and series	
--------------	--	--

## **Description**

c4a\_palettes lists all available cols4all color palettes. Palettes are organized by series. The available series are listed with c4a\_series. Palettes are also organized per functional type, where we currently support: categorical "cat", sequential "seq", and diverging "div"" palette types. The function c4a\_types lists all available types. The function c4a\_overview gives an overview table of the number of palette per series and type. In an IDE with auto-completion (such as RStudio) it is possible to browse through the palette names with .P (using \$ like in lists).

```
c4a_palettes(
  type = c("all", "cat", "seq", "div"),
  series = NULL,
  full.names = TRUE
)

c4a_series(type = c("all", "cat", "seq", "div"), as.data.frame = TRUE)

c4a_types(series = NULL, as.data.frame = TRUE)
```

14 c4a\_palettes

```
c4a_overview()
.P
```

## **Arguments**

type of color palette: one of "all" (all palettes), "cat" (categorical/qualitative

palettes), "seq" (sequential palettes) and "div" (diverging palettes).

series series to list the palettes from. Run c4a\_series to see the options.

full.names should full names, i.e. with the prefix "series."? By default TRUE.

as.data.frame should c4a\_series and c4a\_types return the result as a data.frame, with de-

scription included as a column?

#### **Format**

An object of class environment of length 16.

#### Value

names of the loaded color palettes

### See Also

References of the palettes: cols4all-package.

```
c4a_series()
c4a_types()
c4a_overview()
c4a_palettes(type = "cat", series = "tol")
c4a_palettes(type = "seq", series = "kovesi")
# handy when auto-completion is available:
.P$kovesi$seq$linear_terrain
```

c4a\_plot 15

c4a_plot	Plot a color palette
----------	----------------------

## **Description**

Plot a color palette, either a cols4all palette, or a color vector.

## Usage

```
c4a_plot(palette, ..., include.na = FALSE)
```

## **Arguments**

palette Palette name (see c4a) or a color vector

... arguments passed on to c4a

include.na should a color for missing values be included?

## Value

Besides the plot, a gTree is returned silently

```
c4a_sysdata_import Import and export system data
```

## **Description**

Import and export system data. c4a\_sysdata\_import will import system data and overwrite the current system data, c4a\_sysdata\_export will export the current system data, and c4a\_sysdata\_remove (partly) removes system data.

## Usage

```
c4a_sysdata_import(data)
c4a_sysdata_export()
c4a_sysdata_remove(fullnames = NULL, series = NULL, are.you.sure = NA)
```

## Arguments

data cols4all data (see c4a\_data)

fullnames full palette names (so in the format series.palette\_name)

series a character vector of series names that should be removed (use "all" to remove

all).

are.you.sure are you sure you want to remove series?

#### Value

c4a\_sysdata\_export returns the system data (a list)

#### **Examples**

## Description

col4all scales for ggplot2. The scale functions are organized as scale\_<aesthetic>\_<mapping>\_c4a\_<type>, where the <aesthetic> should be either colo(u)r or fill, <mapping> refers to the mapping that is applied (discrete, continuous or binned), and <type> is the palette type: cat, seq, or div.

```
scale_color_discrete_c4a_cat(
 palette = NULL,
 reverse = FALSE,

```

## Arguments

```
palette, reverse, order, range
See c4a.
... parameters passed on to the underlying scale functions: discrete_scale, continuous_scale, and binned_scale.
mid data value that should be mapped to the mid-point of the diverging color scale
n_interp number of discrete colors that should be used to interpolate the continuous color scale. Recommended to use an odd number to include the midpoint
```

#### Value

A ggplot2 component that defines the scale

```
if (require("ggplot2")) {
data("diamonds")
diam_exp = diamonds[diamonds$price >= 15000, ]
diam_exp$clarity[1:500] = NA
# discrete categorical scale
ggplot(diam_exp, aes(x = carat, y = price, color = color)) +
geom_point(size = 2) +
scale_color_discrete_c4a_cat("carto.safe") +
theme_light()
# missing values
c4a_plot("tol.muted", 8)
ggplot(diam_exp, aes(x = carat, y = price, fill = clarity)) +
geom_point(size = 2, shape = 21) +
scale_fill_discrete_c4a_cat("tol.muted") +
theme_light()
# discrete sequential scale
ggplot(diam_exp, aes(x = carat, y = price, color = cut)) +
geom_point(size = 2) +
scale_color_discrete_c4a_seg("hcl.blues2") +
theme_light()
# continuous sequential scale
ggplot(diam_exp, aes(x = carat, y = price, color = depth)) +
geom_point(size = 2) +
scale\_color\_continuous\_c4a\_seq("hcl.blues2", range = c(0.4, 1)) +
theme_light()
# continuous diverging scale
ggplot(diam_exp, aes(x = carat, y = depth, color = price)) +
geom_point(size = 2) +
scale_color_continuous_c4a_div("wes.zissou1", mid = mean(diam_exp$price)) +
theme_light()
# binned sequential scale
ggplot(diam_exp, aes(x = carat, y = price, color = depth)) +
geom_point(size = 2) +
scale\_color\_binned\_c4a\_seq("scico.batlow", range = c(0.4, 1)) +
theme_light()
}
```
